

# Configuration of circuit breakers in large household electrical distribution boxes

## Overview

Reducing Number of Poles: Use 1P or 1P+N circuit breakers where appropriate, reserving 2P breakers for the main switch and high-power circuits. Why do you need GFCI or AFCI breakers?

Choosing the right size and setup for your distribution box keeps your electrical system safe and working well. You lower the chance of circuits getting too hot or overloaded when you pick the right box for your needs. Circuit breaker wiring configurations involve organizing main switches, busbars. The circuit breaker switch in the household distribution box depends on the area of the owner's house in the community. However, no matter how large. PRO TIP: Wiring a panel is complicated, so many electricians divide the task into steps—cutting wires to length, stripping wire ends, bending wires toward a bus, tightening bus screws—and perform each step on all wires before going on to the next step. Fortunately, there's more room in the main electrical panel than meets the eye if you utilize tandem circuit breakers. Double-pole breakers are shown in locations 1 and 3, and 13 and 15. Instead of providing 120 VAC, these “doubles” provide 240 VAC to the load. A tie bar physically connects the two.
