

Does invisible fiber optic cable require drilling

Overview

It mainly utilizes bend-insensitive G. 657 optical fiber, which allows it to be laid invisibly along wall corners, doorframes, and windows without the need for conduits or drilling. Invisible optical cable (also known as transparent cable) is a specialized type of FOB cable designed specifically for indoor subscriber access (FTTH) with high transparency and slender diameter (approximately 0.2 meters (3-4 feet) deep to reduce the likelihood of accidentally being dug up. In extreme cold climates, cables may need to be buried at greater depths where temperatures are colder and frost penetrates to. Conventional trenching is suitable for open areas, while narrow trenching or horizontal directional drilling (HDD) is often preferred in urban or high-traffic environments to minimize disruption during underground fiber optic cable installation. Using Conduits to Protect Underground Fiber Cables In. Proper planning and preparation are essential to success in fiberoptic cable installation. Before work can begin, you need to take the proper precautions. Unlike traditional open-cut trenching, HDD uses steerable drilling equipment to create precise underground pathways.
