

The router s WAN port is different from the fiber optic cable

Overview

WAN stands for Wide Area Network which is basically the internet. The WAN Port is used to connect the router to your internet connection. Your ISP has supplied you with a modem that builds up the internet connection. But to distribute the i. WAN stands for Wide Area Network which is basically the internet. The WAN Port is used to connect the router to your internet connection. Your ISP has supplied you with a modem that builds up the internet connection. But to distribute the internet connection through your home network you will need a router. The router is connected to the modem, as. On some routers, you will also find a DSL port. The DSL port is smaller than the WAN port, and you can only fit a phone line in it (with an RJ11 connector). The DSL port can be used to directly connect your telephone (DSL) line to your router without the need for a separate modem. The router is in this case a router/modem combination and can build. When you see the status WAN Port is unplugged in your router then there is a problem with your internet connection. The WAN port is connected to your modem, so the ethernet cable between your router and modem and make sure that both ends are connected properly. If the problem persists then try to restart both the router and modem first. If that doe. The WAN cable that is used to connect your router and modem can be a normal ethernet cable. I recommend using a CAT5e or CAT6(a) cable for the connection. CAT5e can handle 1 Gbit per second over a distance of 100 meters. CAT6 can handle 10 gbit over a distance of 55 meters and then drops to 1 Gbit Always use full copper cable, and not copper-coated. I hope found the information useful. If you have any questions just drop a comment below. If you want to know more about setting up your home network, then make sure you read this article where I explain more about it.
